• LP-BACKED CREDIT ON MEZO

Hock
your liquidity.

Borrow MUSD against your share of a BTC/MUSD liquidity position, without unwinding it.

LIVE ON MEZO TESTNET

THE REAL APP, AFTER A DEPOSIT AND BORROW ON CHAIN 31611

• THE PROBLEM

Liquidity providers have capital. They cannot borrow against it.

TODAY

Principal is parked

BTC and MUSD inside a concentrated-liquidity position earn fees and rewards, and do nothing else.

THE COST

Credit means exiting

A staked position is an NFT in a gauge. A lending market cannot take it, so an LP who needs MUSD has to pull liquidity.

HOCK

Shares a market accepts

One pooled position, split into ERC-20 shares that Morpho on Mezo takes as collateral.

Who it is for: Mezo BTC/MUSD liquidity providers who want MUSD credit. Demand is a hypothesis. No outside user has used Hock yet.

• HOW IT WORKS

Deposit once. Your position becomes collateral.

01 DEPOSIT

BTC + MUSD

HockVault adds liquidity on a fixed wide range and stakes it in the Mezo gauge.

→

02 SHARES

HOCK tokens

Depositors get ERC-20 shares of the pooled position. Unused tokens are refunded exactly.

→

03 LOCK

Morpho market

Shares are posted as collateral in a MUSD market at 77% LLTV.

→

04 BORROW

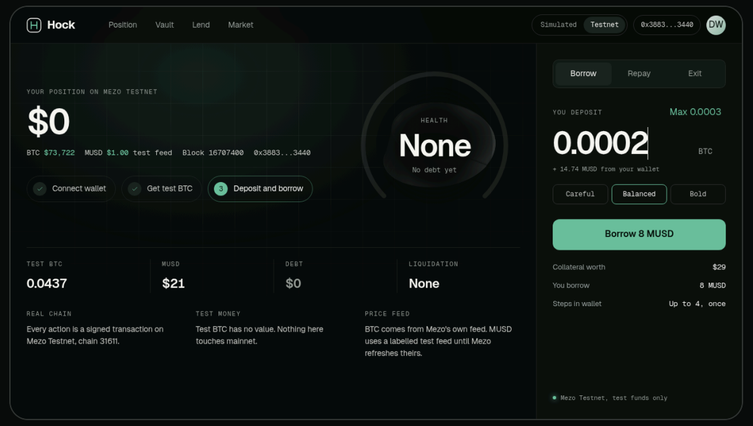

MUSD out

Repay any time. Exit returns the BTC and MUSD.

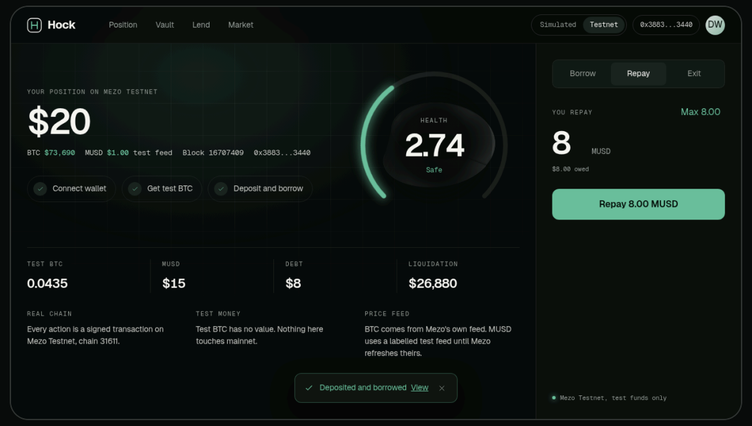

Built on Mezo's own pieces: canonical MUSD, Mezo Pools, the CL gauge and the Mezo Morpho deployment.

• THE PRODUCT

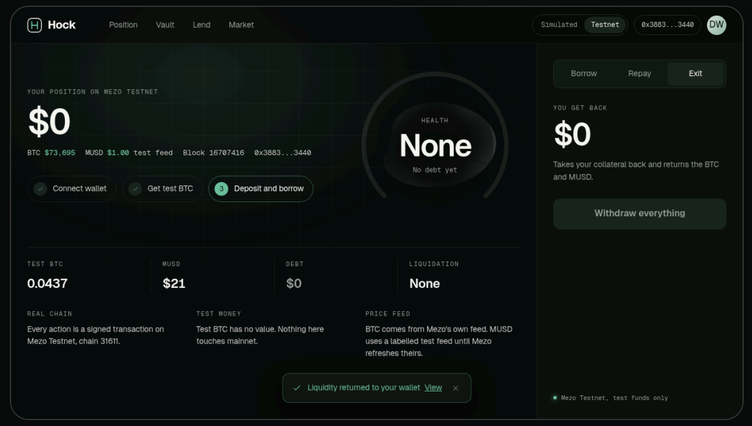

Three actions. Borrow, repay, exit.

TYPE AN AMOUNT, PICK A RISK LEVEL

REPAY IN FULL, NO DUST LEFT

WITHDRAW EVERYTHING

Real screens from the testnet page. A simulation mode runs the same flows with no wallet, for anyone without test funds.

SAFETY

Priced by feeds, never by the pool's spot price.

What the oracle does

- Share value = BTC/USD divided by MUSD/USD. MUSD is never assumed to be one dollar.
- A zero, future-dated or 24-hour-old price reverts the valuation.
- Deposits and harvests revert if spot drifts more than 5% from the fair price.

What we disclose

- On testnet the MUSD/USD price is our own labelled stand-in feed, because Mezo's testnet Pyth feed is stale.
- No TWAP check yet. Owner is keeper and treasury, with no timelock.
- Collateral is an LP position, so it carries impermanent loss. Not audited.

PROOF

It runs on Mezo Testnet today.

CONTRACTS VERIFIED	FULL CYCLE VIA THE UI	CONTRACT TESTS	APP UNIT TESTS

Deposit, lock, borrow, repay, release and withdraw were signed by our own wallet through the app. Every hash is in the README.

• MODEL

The fee follows real rewards.

PROTOCOL FEE

10%

of harvested MEZO gauge rewards goes to the treasury.

DEPOSITORS KEEP

90%

swapped to BTC and MUSD and held by the vault for shareholders.

OTHER FEES

0

No deposit, withdraw or borrow fee. Borrow interest goes to Morpho lenders.

No revenue yet. The fee is in the contract (FEE_BPS = 1000) and only earns when rewards are harvested.

• WHAT IS NEXT

Honest gaps, in the order we will close them.

Still open

- Swap the stand-in MUSD feed for a live one.
- One-click deposit and borrow. The router needs about 9M of a 10M gas block, so the app sends separate steps.
- Put the Vault and Lend pages on chain. Today only Borrow is.
- Security review, TWAP guard, a real liquidation, outside users.
